

FIBERStone

Fibre Reinforced Ceramic Composite

FIBERStone is a combination of high temperature ceramic materials and up to 45% specially alloyed stainless steel fibres. The combination of these materials is directly dependent upon the application of the composite. This product is supplied as a precast shape. Design and engineering of the individual parts take into consideration attachment, internal reinforcement and ease of installation. FIBERStone parts should be considered a “high temperature refractory metal”. It is very effective when applied as a replacement for metal parts that are destroyed by process heat. FIBERStone is also an ideal solution for a wide variety of molten metal contact applications.

- Unequaled Engineering and Design Support
- Internationally Experienced Marketing Support
- Quality Refractory Products
- Exclusivity for Canada
- Entry to the United States and Mexican market places
- Commitment to our goals and mutual success
